1 Seemless data wrangeling

The tidyverse is a bunch of packages and functions written by the same folks that manage Rstudio. The tidyverse builds upon base R to allow for easier use of large datasets.

```
library(tidyverse)
```

```
## Warning: package 'tidyverse' was built under R version 4.4.3
```

```
## Warning: package 'ggplot2' was built under R version 4.4.3
```

```
## -- Attaching core tidyverse packages ------------------------ tidyverse 2.0.0 --
## v dplyr     1.1.4     v readr     2.1.5
## v forcats   1.0.0     v stringr   1.5.1
## v ggplot2   4.0.2     v tibble    3.2.1
## v lubridate 1.9.4     v tidyr     1.3.1
## v purrr     1.0.2
## -- Conflicts ------------------------------------------ tidyverse_conflicts() --
## x dplyr::filter() masks stats::filter()
## x dplyr::lag()    masks stats::lag()
## i Use the conflicted package (<http://conflicted.r-lib.org/>) to force all conflicts to become errors
```

When you load in the tidyverse notice that it loads in 8 different packages. You will not have to load these individually.

More info and cheet sheets can be found here: https://tidyr.tidyverse.org/index.html

Lets demonstrate some of the most useful functionality of some tidyverse functions. We will cover the following: - Data wrangling & manipulation - mutate() - select() - filter() - the pipe %>% - summarise() - group_by() - joining - pivotting - Integration with plotting

```r
microbiome.fungi <- read.csv(file.choose())
str(microbiome.fungi)
```

```
## 'data.frame':    287 obs. of  16 variables:
##  $ SampleID       : chr  "Corn2017LeafObjective2Collection1T1R1CAH2" "Corn2017LeafObjective2Collectio
##  $ Crop           : chr  "Corn" "Corn" "Corn" "Corn" ...
##  $ Objective      : chr  "Objective 2" "Objective 2" "Objective 2" "Objective 2" ...
##  $ Collection     : int  1 1 1 1 1 1 1 1 1 1 ...
##  $ Compartment    : chr  "Leaf" "Leaf" "Leaf" "Leaf" ...
##  $ DateSampled    : chr  "6/26/2017" "6/26/2017" "6/26/2017" "6/26/2017" ...
##  $ GrowthStage    : chr  "V6" "V6" "V6" "V6" ...
##  $ Treatment      : chr  "Conv." "Conv." "Conv." "Conv." ...
##  $ Rep            : chr  "R1" "R1" "R1" "R1" ...
##  $ Sample         : chr  "A" "B" "C" "A" ...
##  $ Fungicide      : chr  "C" "C" "C" "F" ...
##  $ Target_organism: chr  "Fungi" "Fungi" "Fungi" "Fungi" ...
##  $ Location       : chr  "Kellogg Biological Station" "Kellogg Biological Station" "Kellogg Biologica
##  $ Experiment     : chr  "LTER" "LTER" "LTER" "LTER" ...
##  $ Year           : int  2017 2017 2017 2017 2017 2017 2017 2017 2017 2017 ...
##  $ richness       : int  9 6 5 7 4 2 3 8 4 4 ...
```

```r
getwd()
```

```
## [1] "C:/Users/gzb0078/OneDrive - Auburn University/Documents/Reproducibility-GB/Homework"
```

Lets start exploring the data.

Sometimes you may want to only select certain columns of your data. This is accomplished with the select function..

2 select()

```r
microbiome.fungi2 <- select(microbiome.fungi, SampleID, Crop, Compartment:Fungicide, richness)

str(microbiome.fungi2)
```

```
## 'data.frame':    287 obs. of  10 variables:
##  $ SampleID   : chr  "Corn2017LeafObjective2Collection1T1R1CAH2" "Corn2017LeafObjective2Collection1T
##  $ Crop       : chr  "Corn" "Corn" "Corn" "Corn" ...
##  $ Compartment: chr  "Leaf" "Leaf" "Leaf" "Leaf" ...
##  $ DateSampled: chr  "6/26/2017" "6/26/2017" "6/26/2017" "6/26/2017" ...
##  $ GrowthStage: chr  "V6" "V6" "V6" "V6" ...
##  $ Treatment  : chr  "Conv." "Conv." "Conv." "Conv." ...
##  $ Rep        : chr  "R1" "R1" "R1" "R1" ...
##  $ Sample     : chr  "A" "B" "C" "A" ...
##  $ Fungicide  : chr  "C" "C" "C" "F" ...
##  $ richness   : int  9 6 5 7 4 2 3 8 4 4 ...
```

Note the syntax. I listed all the column headers I wanted, but at the end I used `Compartment:Fungicide` because all these were in order and I can use the column to select them all.

3 filter()

This is a convenient function that allows you to subset data fairly easily.

```r
head(filter(microbiome.fungi2, Treatment == "Conv."))
```

```
##                                   SampleID Crop Compartment DateSampled
## 1 Corn2017LeafObjective2Collection1T1R1CAH2 Corn        Leaf   6/26/2017
## 2 Corn2017LeafObjective2Collection1T1R1CBA3 Corn        Leaf   6/26/2017
## 3 Corn2017LeafObjective2Collection1T1R1CCB3 Corn        Leaf   6/26/2017
## 4 Corn2017LeafObjective2Collection1T1R1FAC3 Corn        Leaf   6/26/2017
## 5 Corn2017LeafObjective2Collection1T1R1FBD3 Corn        Leaf   6/26/2017
## 6 Corn2017LeafObjective2Collection1T1R1FCE3 Corn        Leaf   6/26/2017
##   GrowthStage Treatment Rep Sample Fungicide richness
## 1          V6     Conv.  R1      A         C        9
## 2          V6     Conv.  R1      B         C        6
## 3          V6     Conv.  R1      C         C        5
## 4          V6     Conv.  R1      A         F        7
## 5          V6     Conv.  R1      B         F        4
## 6          V6     Conv.  R1      C         F        2
```

4 A more complex using &

```r
head(filter(microbiome.fungi2, Treatment == "Conv." & Fungicide == "C"))
```

```
##                                   SampleID Crop Compartment DateSampled
## 1 Corn2017LeafObjective2Collection1T1R1CAH2 Corn        Leaf   6/26/2017
## 2 Corn2017LeafObjective2Collection1T1R1CBA3 Corn        Leaf   6/26/2017
```

```
## 3 Corn2017LeafObjective2Collection1T1R1CCB3 Corn        Leaf   6/26/2017
## 4 Corn2017LeafObjective2Collection1T1R2CAF3 Corn        Leaf   6/26/2017
## 5 Corn2017LeafObjective2Collection1T1R2CBG3 Corn        Leaf   6/26/2017
## 6 Corn2017LeafObjective2Collection1T1R2CCH3 Corn        Leaf   6/26/2017
##   GrowthStage Treatment Rep Sample Fungicide richness
## 1          V6     Conv.  R1      A         C        9
## 2          V6     Conv.  R1      B         C        6
## 3          V6     Conv.  R1      C         C        5
## 4          V6     Conv.  R2      A         C        3
## 5          V6     Conv.  R2      B         C        8
## 6          V6     Conv.  R2      C         C        4
```

5 Another more complex example using or |

```r
head(filter(microbiome.fungi2, Sample == "A" | Sample == "B")) # samples A or B
```

```
##                                   SampleID Crop Compartment DateSampled
## 1 Corn2017LeafObjective2Collection1T1R1CAH2 Corn        Leaf   6/26/2017
## 2 Corn2017LeafObjective2Collection1T1R1CBA3 Corn        Leaf   6/26/2017
## 3 Corn2017LeafObjective2Collection1T1R1FAC3 Corn        Leaf   6/26/2017
## 4 Corn2017LeafObjective2Collection1T1R1FBD3 Corn        Leaf   6/26/2017
## 5 Corn2017LeafObjective2Collection1T1R2CAF3 Corn        Leaf   6/26/2017
## 6 Corn2017LeafObjective2Collection1T1R2CBG3 Corn        Leaf   6/26/2017
##   GrowthStage Treatment Rep Sample Fungicide richness
## 1          V6     Conv.  R1      A         C        9
## 2          V6     Conv.  R1      B         C        6
## 3          V6     Conv.  R1      A         F        7
## 4          V6     Conv.  R1      B         F        4
## 5          V6     Conv.  R2      A         C        3
## 6          V6     Conv.  R2      B         C        8
```

6 mutate()

Mutate allows us to quickly create new columns.

```r
microbiome.fungi2$logRich <- log(microbiome.fungi2$richness)
microbiome.fungi2$logRich
```

```

7 the pipe

We can also combine multiple functions together. This is an important concept and is very powerful. It helps to try to visualize what you are doing to your data at each step. Basically the pipe allows you to input the previous data from the right side of the pipe into the function on the left (or next line).

In this

We will combine all previous steps into one large string of functions.

When we do this we do not have to specify the data in each function. The data from the previous step is transfered to the next step.

```r
select(microbiome.fungi, SampleID, Crop, Compartment:Fungicide, richness) # before
```

```

```

8 summarise()

We can use the `summarise()` function to find things like means and standard deviations/errors.

```
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns
  filter(Treatment == "Conv.") %>% # subsetting to only include the conventional treatment
  mutate(logRich = log(richness)) %>% # creating a new column of the log richness
  summarise(Mean.rich = mean(logRich)) # calculating overall mean log richness within the conventionall
```

```
##   Mean.rich
## 1  2.304395
```

We can also connect multiple summary statistics here.

```r
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns
  filter(Treatment == "Conv.") %>% # subsetting to only include the conventional treatment
  mutate(logRich = log(richness)) %>% # creating a new column of the log richness
  summarise(Mean.rich = mean(logRich), # calculating the mean richness, stdeviation, and standard error
            n = n(),
            sd.dev = sd(logRich)) %>%
  mutate(std.err = sd.dev/sqrt(n))
```

```
##   Mean.rich   n    sd.dev   std.err
## 1  2.304395 144 0.7024667 0.0585389
```

This is useful, but maybe we want to have summary statistics by group! We can also do this very easily using the `group_by()` function.

```r
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>%
  group_by(Treatment, Fungicide) %>%
  mutate(logRich = log(richness)) %>%
  summarise(
    Mean.rich = mean(logRich),
    n = n(),
    sd.dev = sd(logRich),
    .groups = "drop"
  ) %>%
  mutate(std.err = sd.dev / sqrt(n))
```

```
## # A tibble: 4 x 6
##   Treatment Fungicide Mean.rich     n sd.dev std.err
##   <chr>     <chr>         <dbl> <int>  <dbl>   <dbl>
## 1 Conv.     C              2.53    72  0.635  0.0748
## 2 Conv.     F              2.07    72  0.696  0.0820
## 3 No-till   C              2.63    72  0.513  0.0604
## 4 No-till   F              2.36    71  0.680  0.0807
```

9 Connecting to plotting

These groups of functions and packages also all work together very nicely. For example, direct input into ggplot is possible. In which case you would not have to enter the data statement, you just need to start inputing your aesthetics.

```r
plot1 <- microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns
  group_by(Treatment, Fungicide) %>% # grouping by treatment and fungicide to later calculate summary s
  mutate(logRich = log(richness)) %>% # creating a new column of the log richness
  summarise(Mean.rich = mean(logRich), # calculating the mean richness, stdeviation, and standard error
            n = n(),
            sd.dev = sd(logRich)) %>%
  mutate(std.err = sd.dev/sqrt(n)) %>%
  ggplot(aes(x = Fungicide, y = Mean.rich)) + # adding in a ggplot
```

```
  geom_bar(stat="identity") +
  geom_errorbar( aes(x=Fungicide, ymin=Mean.rich-std.err, ymax=Mean.rich+std.err), width=0.4) +
  theme_minimal() +
  xlab("") +
  ylab("Log Richness") +
  facet_wrap(~Treatment)
```

```
## `summarise()` has grouped output by 'Treatment'. You can override using the
## `.groups` argument.
```

10 Joining

The join group of functions are super useful. Have you ever tried to match up data by rows based on some criteria? Its almost impossible without messing up over 10-15 rows of data.

More info can be found here: https://dplyr.tidyverse.org/reference/mutate-joins.html

But we can easily do this with the joining functions. They include:

-left_join() - Keep all rows of X and add matching rows from Y. Any rows in Y that don't match X are excluded. -right_join() - reverse of left_join() -inner_join() - only keep rows that are common to both X AND Y, remove everything else. -full_join() - Keep any columns that are in either X or Y

To try these out lets split our data into separate sets including taxonomy and metadata.

Here we are also sampling 100 random rows of our dataset using the `sample_n()` function

```
# selecting just the richness and sample ID
richness <- microbiome.fungi %>%
  select(SampleID, richness)

# selecting columns that don't include the richness
metadata <- microbiome.fungi %>%
  select(SampleID, Fungicide, Crop, Compartment, GrowthStage, Treatment, Rep, Sample)

head(metadata)
```

```
##                                   SampleID Fungicide Crop Compartment
## 1 Corn2017LeafObjective2Collection1T1R1CAH2         C Corn        Leaf
## 2 Corn2017LeafObjective2Collection1T1R1CBA3         C Corn        Leaf
## 3 Corn2017LeafObjective2Collection1T1R1CCB3         C Corn        Leaf
## 4 Corn2017LeafObjective2Collection1T1R1FAC3         F Corn        Leaf

## 6 Corn2017LeafObjective2Collection1T1R1FCE3         F Corn        Leaf
##   GrowthStage Treatment Rep Sample
## 1          V6     Conv.  R1      A
## 2          V6     Conv.  R1      B
## 3          V6     Conv.  R1      C
## 4          V6     Conv.  R1      A
## 5          V6     Conv.  R1      B
## 6          V6     Conv.  R1      C
```

```r
head(richness)
```

```
##                                   SampleID richness
## 1 Corn2017LeafObjective2Collection1T1R1CAH2        9
## 2 Corn2017LeafObjective2Collection1T1R1CBA3        6
## 3 Corn2017LeafObjective2Collection1T1R1CCB3        5
## 4 Corn2017LeafObjective2Collection1T1R1FAC3        7
## 5 Corn2017LeafObjective2Collection1T1R1FBD3        4
## 6 Corn2017LeafObjective2Collection1T1R1FCE3        2
```

```r
head(left_join(metadata, richness, by = "SampleID")) # adding the richness data to the metadata based o
```

```
##                                   SampleID Fungicide Crop Compartment
## 1 Corn2017LeafObjective2Collection1T1R1CAH2         C Corn        Leaf
## 2 Corn2017LeafObjective2Collection1T1R1CBA3         C Corn        Leaf
## 3 Corn2017LeafObjective2Collection1T1R1CCB3         C Corn        Leaf
## 4 Corn2017LeafObjective2Collection1T1R1FAC3         F Corn        Leaf
## 5 Corn2017LeafObjective2Collection1T1R1FBD3         F Corn        Leaf
## 6 Corn2017LeafObjective2Collection1T1R1FCE3         F Corn        Leaf
##   GrowthStage Treatment Rep Sample richness
## 1          V6     Conv.  R1      A        9
## 2          V6     Conv.  R1      B        6
## 3          V6     Conv.  R1      C        5
## 4          V6     Conv.  R1      A        7
## 5          V6     Conv.  R1      B        4
## 6          V6     Conv.  R1      C        2
```

Now this is kind of a silly example because we already had the data set joined how we wanted it and split it apart. But you can imagine if you have two separate data sets with one column in common and you wanted to combine them into one, instead of taking days to do this by hand you could simply load into R and do it.

11 Pivoting

Pivoting is also useful for converting from wide to long format and back again. We can do this with `pivot_longer()` and `pivot_wider()`

More info can be found here: https://tidyr.tidyverse.org/reference/pivot_wider.html

I will demonstrate `pivot_wider()` assuming that most data is already formatted as long data. Lets explore turning our data set into a wide format, since its in long format.

```r
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>%
  group_by(Treatment, Fungicide) %>% # grouping by treatment and fungicide to later calculate summary s
  summarise(Mean = mean(richness)) # calculates the mean per Treatment and Fungicide
```

```
## `summarise()` has grouped output by 'Treatment'. You can override using the
## `.groups` argument.
```

```
## # A tibble: 4 x 3
## # Groups:   Treatment [2]
```

```
##   Treatment Fungicide  Mean
##   <chr>     <chr>     <dbl>
## 1 Conv.     C         14.6
## 2 Conv.     F          9.75
## 3 No-till   C         15.4
## 4 No-till   F         13.1
```

Wide format - sets the values within the fungicide column into column names

```
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns
  group_by(Treatment, Fungicide) %>% # grouping by treatment and fungicide to later calculate summary s
  summarise(Mean = mean(richness)) %>% # calculates the mean per Treatment and Fungicide
  pivot_wider(names_from = Fungicide, values_from = Mean) # pivot to wide format
```

```
## `summarise()` has grouped output by 'Treatment'. You can override using the
## `.groups` argument.
```

```
## # A tibble: 2 x 3
## # Groups:   Treatment [2]
##   Treatment     C     F
##   <chr>     <dbl> <dbl>
## 1 Conv.      14.6  9.75
## 2 No-till    15.4 13.1
```

Easily can take the difference bewteen the fungicide and control now.

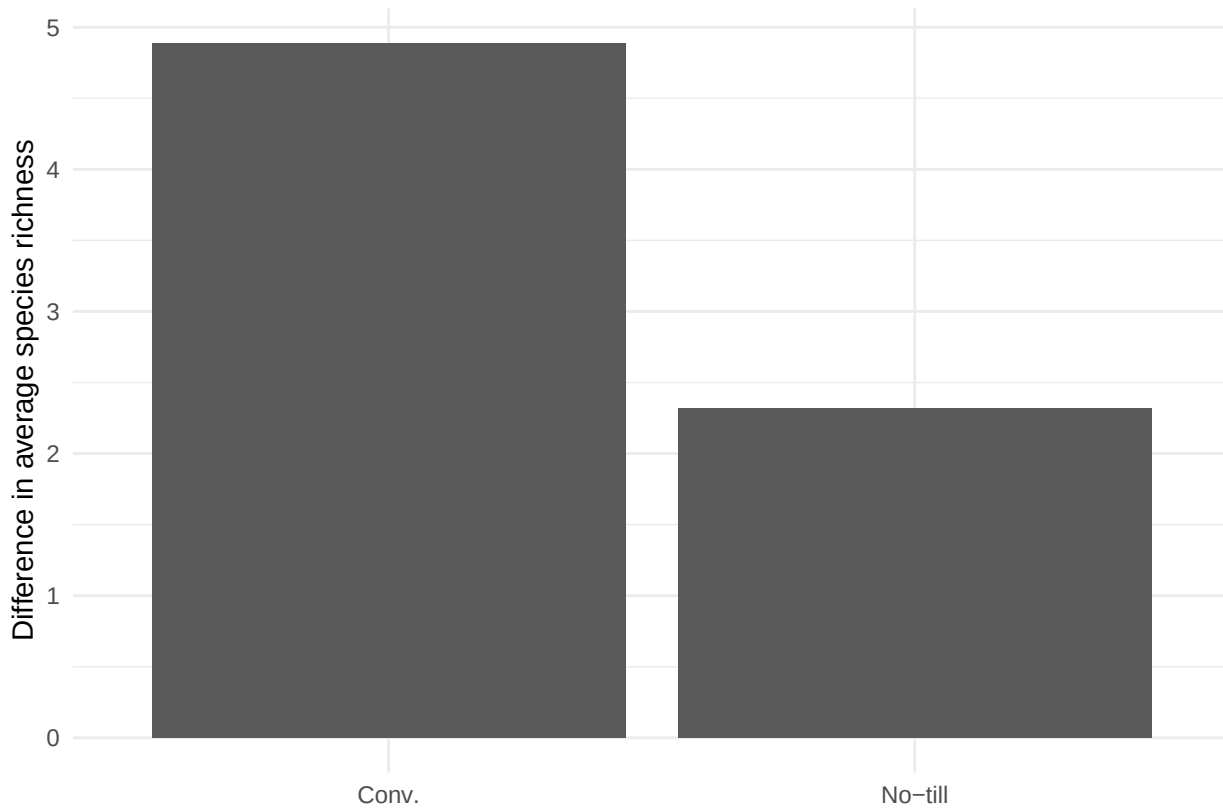
```
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns  filter(Class == "Sor
  group_by(Treatment, Fungicide) %>% # grouping by treatment and fungicide to later calculate summary s
  summarise(Mean = mean(richness)) %>% # calculates the mean per Treatment and Fungicide
  pivot_wider(names_from = Fungicide, values_from = Mean) %>% # pivot to wide format
  mutate(diff.fungicide = C - F) # calculate the difference between the means.
```

```
## `summarise()` has grouped output by 'Treatment'. You can override using the
## `.groups` argument.
```

```
## # A tibble: 2 x 4
## # Groups:   Treatment [2]
##   Treatment     C     F diff.fungicide
##   <chr>     <dbl> <dbl>          <dbl>
## 1 Conv.      14.6  9.75           4.89
## 2 No-till    15.4 13.1            2.32
```

Now we can easily calculate the difference between fungicide and control and plot it.

```
microbiome.fungi %>%
  select(SampleID, Crop, Compartment:Fungicide, richness) %>% # selecting columns  filter(Class == "Sor
  group_by(Treatment, Fungicide) %>% # grouping by treatment and fungicide to later calculate summary s
  summarise(Mean = mean(richness)) %>% # calculates the mean per Treatment and Fungicide
  pivot_wider(names_from = Fungicide, values_from = Mean) %>% # pivot to wide format
```

```r
  mutate(diff.fungicide = C - F) %>%  # calculate the difference between the means.
  ggplot(aes(x = Treatment, y = diff.fungicide)) + # Plot it
  geom_col() +
  theme_minimal() +
  xlab("") +
  ylab("Difference in average species richness")
```


```
## `summarise()` has grouped output by 'Treatment'. You can override using the
## `.groups` argument.
```
